

ABSTRACT OF THE DISCLOSURE

A compound fabric for making protective cover includes at least three layers of fabrics, namely, upper and lower layer that are
05 waterproof and air-permeable non-woven fabrics made of polypropylene, or polyethylene, or polyester fibers, and the middle layer that is a woven or knitted fabric specially treated to have waterproof and air-permeable properties. The non-woven upper and lower layers enable the compound fabric to be pliable, solid, thick, and
10 tough, and the woven middle layer enables the compound fabric to have largely enhanced tensile strength and tear strength, so that a protective cover made of the compound fabric is not only tough and pliable but also waterproof and air-permeable to provide good protective effect.
